Sprint Report 2

Team: Plugged In

Members: Marshall Gaucher, Kevin Worner, David Jarman

Project: STBMF

Reports will describe the backlog and burndown. It should describe the prototype and its features. You should include the activities (since the last report) such as meetings, client interactions, research, code experiments, etc. Be sure to describe which team member did what activity.

Product Backlog

- Server: UI - Stats, Import
- Server: Encryption - AES, Blowfish
- Server: Design: game interface - loading game, playing game
- Server: cmd message - look at jordan's serializer
- Server: logger
- Server: Future - server components, database
- Server: sanity check message - validate header and encryption
- Server: TCP: connections to APMax, - receiving and sending Server Tests
- vAPMax: Unit Testing
- vAPMax: Blocking/Deblocking
- vAPMax Encryption/Decryption using AES
- vAPMax: Integrate Logger into project and provide basic command line usage to view.
- Prototype: vAPMax
- vSTB: Unit Testing
- vAPMax: Research CommandLink header info, so we know what is expected from STB
- command link 2 unwrapping from receive
- command link 2 wrapping to send forward command link 1 to proper game instance
- Server: Plugin Interface
- Server: Design logic and data flow
- vSTB: Create Checkers game as a proof of concept
- vSTB: Prove out and implement QUiLoader
- Server: Build template GUI
- vSTB: Research Dynamic UI
- vSTB: Refactor existing STB game view/model architecture to meet STBMF requirements
- Server: Research Server operating systems
- vSTB: Create Memory game as a proof of concept
- Server: Research Security
- vSTB: UDP command message
- vSTB: TCP command message

STBMF Prototype

- Server – Kevin Worner
- vAPMAX- David Jarman
- vSTB- Marshall Gaucher

vSTB Features

- Communication Layer component allows the vSTB to send and receive UDP and TCP messages that are defined in the Command Message protocol.
- Creates a modular and scalable framework to work with existing games on the STB
- Ultimately reduces the current load on the STB since resources are requested instead of stored locally

GameServer Features

- Created a TCP communications wrapper. At the moment, it merely echo's back what it received.
- Halfway through translating network messages from paper design to code.
- Created a very simple prototype of server UI.
- All code currently in the server is covered with a test.

vAPMax Features

- Researched Reactive Extension (Rx) in order to handle TCP/UDP packet receiving/sending.
- Created a UDP and a TCP server using Rx and stubbed out basic handling of packets.
- Researched socket programming to become effective in handling packet sending and receiving

Scrum Meetings

- Refined communication of existing network so we can understand how to implement it on our components
- Refined scope of each component
- Updated product backlog to give our client a vision and sense of progress

Research

- CommandLink Message
- Reactive Extension for Server and vAPMAX
- SI Stream

Code Experiments

- vSTB
    - Implementing existing STB code using Qt libraries to make it platform independent
- vAPMAX
    - Implemented UDP and TCP communication using Reactive Extensions.
- Server
    - Implemented UDP communications. Discarded after clarification of network structure.
